UI Design

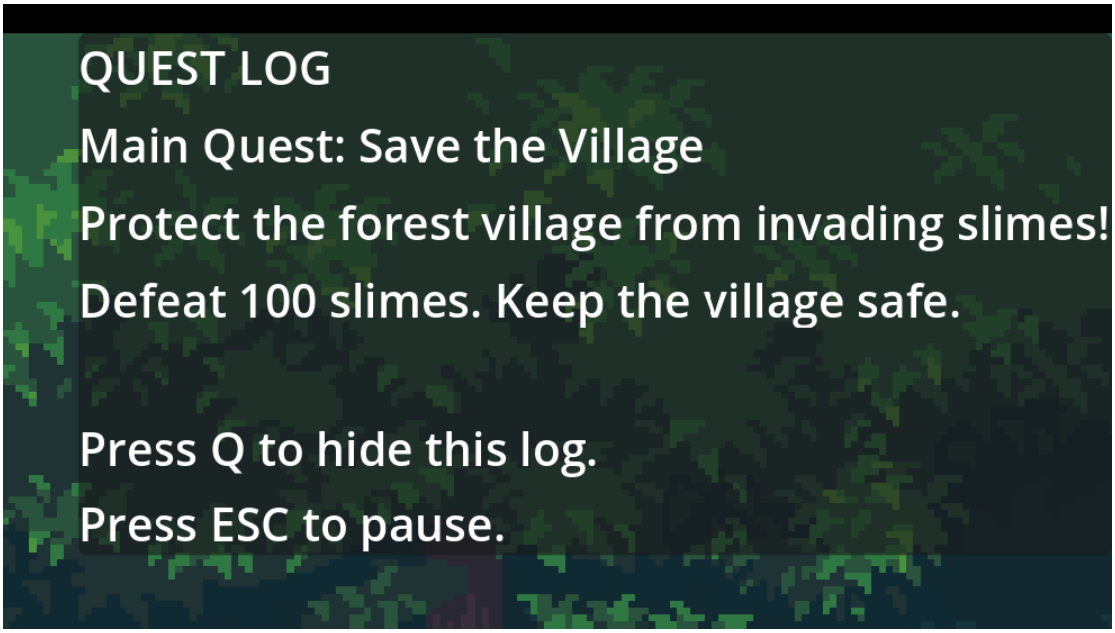

1. Kill Counter

States:
The counter starts at 0/100 and increases when the player defeats a slime. It stops updating when the game ends.
Data Flow:
The counter reads the score from GameManager.gd. When a slime is defeated, the score increases by one and the displayed number updates.
Keyboard Accessibility:
The counter does not require mouse interaction. Players can read it while controlling the character with the keyboard.
Feedback:
The increasing number confirms that a slime has been defeated. When the score reaches 100, the victory screen appears.
Edge Cases:
The counter starts at zero. The target is 100 slimes. The text is short and fixed, so long strings are not expected.
Save and Load:
The score resets to zero when the scene restarts. The game does not currently have a save system.
Discoverability:
The counter is visible during gameplay, so players can easily track their progress.

2. Quest Log

States:
The Quest Log has two states: open and closed. It is hidden by default.
Data Flow:
The Quest Log displays the main mission, its description, and the objective. The information is currently static.
Keyboard Accessibility:
Players can press Q to open or close the Quest Log without using the mouse.
Feedback:
The panel appears when Q is pressed and disappears when Q is pressed again.
Edge Cases:
The Quest Log contains a fixed objective. Longer descriptions can be wrapped onto multiple lines. It does not require numerical input.
Save and Load:
The Quest Log does not store progress separately. It returns to its default closed state when the scene restarts.
Discoverability:
The Q shortcut should be explained on the start screen so that new players know how to open the Quest Log.

3. Pause Menu

States:
The Pause Menu has two main states: paused and resumed. It is hidden during normal gameplay.
Data Flow:
The menu changes the game's paused state. When paused, gameplay stops. When resumed, gameplay continues. Restart reloads the current scene.
Keyboard Accessibility:
Players can press Esc to pause or resume. The buttons can also be selected using the keyboard.
Feedback:
The Pause Menu appears when the game is paused. The player and enemies stop moving. Selecting Resume closes the menu, while Restart starts the game again.
Edge Cases:
The Pause Menu is only available during active gameplay. It does not require numerical input. Button labels are short and fixed.
Save and Load:
Restart resets the game, including the score and enemy positions. There is no persistent save system.
Discoverability:
The Esc shortcut should be included in the start screen instructions. The Resume and Restart buttons have clear labels.
